Recommended Site Preparation

Correct site preparation is essential to ensure a long and trouble-free life for your tank.

It is essential to have your water tank on a **FLAT LEVEL COMPACTED BASE**. The base of your water tank must be fully supported at all times.

CONCRETE SLAB

Concrete Slab must be at least 25mpa and 100mm (4") thick with F62 mesh halfway through the mix. It should be screeded flat and level with no high or low spots. The finished surface should have a trowelled finish.

CRUSHER DUST

Crusher dust bases must be 300mm (12") wider than diameter of the water tank and prepared as follows:

1. Remove at least 100mm (4") of natural earth, ensuring the base is flat and level.
2. Refill with at least 75mm (3") of crusher dust thoroughly mixed with dry cement powder (for a 4m (13') base we suggest 2-3 bags of cement powder).
3. Once spread, thoroughly compact the crusher dust with suitable compacting equipment, not by any other means.
4. Thoroughly screed the surface and ensure the finished surface is perfectly **FLAT AND LEVEL** and free of stones, tree roots, etc. Do not water to set the cement powder, natural moisture will do this when your tank is in position.

Note: Sand is not acceptable.

Inspect the base Regularly checking for and rectifying any undermining by water run-off or animals burrowing such as toads and mice etc.

MOLASSES TANKS

Molasses tanks must have a concrete slab or suitably constructed tank stand with flat level deck to be considered for warranty.
